**Non Toxic Biodegradable**

### ***Here's How It Works***

***Our Ultrasonic CLEAN HIT equipment consists of a water tanks with a heating element and a series of ultrasonic transducers on the sides and bottom of the tank. The element heats the water to the ideal temperature for ultrasonic cleaning after which the clubs are inserted. The transducers produce waves of ultrasonic energy in the water which create thousands of tiny air bubbles. When the air bubbles come in contact with the golf club they implode with incredible force pulling dirt and debris from the club heads and grips, leaving them clean and dirt free.***

### **Directions:**

**Be sure to use warm water to start with and allow the heating elements to bring the solution to the correct temperature. Fill the tank to within 5 inches of the top with warm to hot water. Add 2 oz of the biodegradable cleaning solution to the water. Begin with placing the grips in the solution first. When ready, flip the activation switch which is preprogrammed for 3 minutes of cleaning time. When finished, dry the grips to remove any residue and then place the heads into the solution. Reactivate the switch. If more time is needed, flip it again for another three minutes. Some scrubbing may be necessary for rust removal and for hardened in groove crevices.**

**Dry your cubs with cloth provided...back to the game and good hitting.**

**Care must be taken not to place anything other than clubs in the tank when cleaning golf clubs. Insert the clubs one or two at a time in the tank until all clubs are in and be sure that there is enough room for each club. It is not necessary to move the clubs when the ultrasonics are on but repositioning them may speed up the process.**
